

## InterActive Desk Finishes

Hardrock Maple

Newport Apple

Hayward Cherry

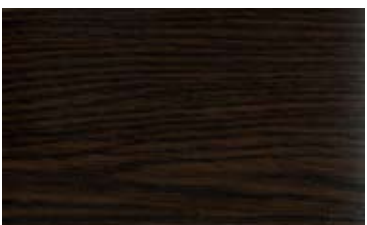

Cordovan Walnut

Pearwood

Shadow Oak

### Desktop Finishes -

Standard InterActive finishes are wood grain laminate. Solid colors and other patterns are available subject to availability and may involve longer lead times and upcharge fees or minimum order sizes. A wider range of colors are available for commercial plans involving multiple units.

Our laminates are all Surf X Thermafoil laminates by Omnova which have a unique abrasion resistant coating and have been tested by independent laboratories to provide greater scratch resistance than typical countertop laminates (test results are available on request). Remember that darker finishes in any material will show wear more than mid or light tones. Thermafoil laminates are formed around all edges under heat, pressure, and vacuum to provide for a beautiful uniform surface without glue lines or edgebands. Thermafoils are very resistant to delamination over long periods of use. The technology of thermafoils allows WorkSpaces to design desk tops in almost any geometric shape at a very affordable price (compared to solid wood). The interior core of InterActive surfaces is Medium Density Fiberboard (MDF) and not particleboard. MDF is a very dense fibrous material that does not flake or disintegrate like particleboard when cut or shaped. MDF is significantly more resistant to sag and warp than particleboard.

The InterActive Desk line is a modular desk design, meaning that wood grain for each modular worksurface will run the length of the piece but may be at 90 degrees to an adjoining piece.

### Metal Finishes -

Metal finishes are black and silver. Other colors are only available on larger commercial orders.
